Honours Bachelor of Software Engineering Co-op | University of Waterloo | 2018 - 2023 (Expected)

Skills

Backend Languages: C++, C, Golang, Python, Node.js, TypeScript
Infrastructure: SQL, Postgres, InfluxDB, Docker, AWS, EC2, OpenVPN
Tooling: Vim, Git, Linux, Jupyter, Databricks
Application Development: JavaScript, React, Swift, HTML, CSS, jQuery

Work Experience

Software Engineering Intern at Kik Interactive (Python, Docker, SQL) May - Aug. 2019

- Rebuilt the A/B testing system in Python to simplify demographic segmentation and result visualization for managers.
- Integrated data from AWS Kinesis Streaming to quicken spam classification **from 5 to 2 minutes**.
- Provisioned Docker environments to host Airflow jobs allowing for engineers to consistently schedule jobs.
- Engineered a SQL testing framework which laid the groundwork for proper testing across all data science projects.
- Shipped jobs to monitor data relevance and to identify uncaught spam accounts which accelerated spam terminations.

Software Engineering Intern at Big Terminal Inc. (Node.js, TypeScript, InfluxDB) Aug. 2018

- Developed a Node.js server that identifies arbitrage opportunities on cryptocurrency markets to traders on Slack.
- Wrote a bot to lend USD at favourable rates, allowing for higher capital utilization.

Data Scientist at Flipp Corporation (Python, Pandas, Scikit-Learn) July - Aug. 2017

- Evaluated as a **top employee in the 95th percentile** (bit.ly/flipp_eval).
- Created a Python résumé parser which was capable of categorizing sections and outperformed licensed tools.
- Engineered and tuned an ML ensemble to a **precision of 0.598** which filtered out candidates with poor résumés.
- Generated N-grams, a bag-of-words, and a hand-picked dictionary as a feature space for modelling.
- Frequently sought out meetings with the Talent team to present findings and to shape business direction.

Awards (Hackathon Count: 25 | Wins: 12)

Winner at Hack the North 2019 (1500 participants | TypeScript, Python | bit.ly/prj_complete)

- Created a VSCode extension that helps developers write code faster by autogenerating functions from pseudocode.
- Blitzed through the VSCode API documentation, then developed the client, middleware, and optimized network requests.

Winner at Hack the North 2016 (1000 participants | Angular, Node.js, SQL | bit.ly/prj_agrigate)

- Engineered a dashboard that uses satellite data from NASA and Ontario's land surveys to identify crop growing conditions.
- Built a statistical model to project future crop prices and help farmers determine selling opportunities.

Second Place at MHacks 9 (300 participants | React, Firebase | bit.ly/prj_recap)

- Created a text editor that archives a presenter's audio to provide further context behind student notes.
- Developed middleware to fetch and align audio recordings from Firebase DB with edited notes.

Projects

Lizzie - Collecting my personal metrics (Golang, Swift, InfluxDB, OpenVPN | bit.ly/prj_lizzie)

- Built a "News Feed" in React to dashboard my biometrics, reflect on things I've learned, and to monitor daily activities.
- Wrote a Golang server under an OpenVPN network to store my biometrics from an iOS and watchOS app.
- Developed a Chrome extension to archive my search terms and messages that I've sent to optimize how I communicate.

Parabola - An AR overlay that predicts where objects land (C++, OpenCV | bit.ly/prj_parabola)

- Wrote a concurrent C++ server that uses stereoscopic cameras and OpenCV to identify the location of an orange cone.
- Calculated the landing position of the cone using classical mechanics.
